FAQ

Clean an Image — Free

100% client-side — files never leave this device

Drop your image here

or

Browse files

JPEG · PNG · WebP · max 50 MB

Instant local processing

100% private — zero upload

Lossless — ICC profile kept

HOW IT WORKS

Upload to clean file in seconds

No queue, no server, no re-compression. The whole pipeline runs in a Web Worker on your device.

01

Drop the final file

Drag in the JPEG, PNG or WebP you are about to post. It never leaves your browser tab.

02

We strip the AI signals

Binary-level cleaning removes C2PA (APP11) and EXIF/XMP (APP1) segments — pixels and ICC color profile stay byte-identical.

03

Download & post

Get name_cleaned.jpg back in about 0.3s — ready for Instagram, TikTok, Etsy or your portfolio.

midjourney_portrait_final.png

4.2 MB → 3.9 MB · PNG · cleaned in 0.28s

Cleaned

WHAT WE REMOVE

Every hidden field, gone in one pass

EXIF Data

Camera model, settings, timestamps and device identifiers.

GPS & Location

Geotags and coordinates embedded by phones and cameras.

XMP & IPTC

Creator info, copyright fields, keywords and edit history.

C2PA Credentials

Provenance signatures from Firefly, Photoshop and CAI tools.

Stable Diffusion Params

Prompts, seeds, CFG scale, sampler and model hash.

AI Generator Tags

DALL·E, MidJourney, Firefly and other AI fingerprints.

PNG Info Chunks

tEXt, iTXt and zTXt chunks used by SD interfaces.

What we keep

ICC color profile, pixels, transparency — byte-identical output, zero color shift. Canvas-based tools can't say that.

PLATFORMS

Built for where you publish

Instagram

Feed posts, carousels and Reels covers get the AI Info tag when C2PA is present. Clean each asset before upload.

Guide: /remove-ai-label-instagram

TikTok

Auto-labels can't be edited after posting. Strip Content Credentials from covers and image posts first.

Guide: /remove-ai-detection-tiktok

Photographers

Generative Fill leaves C2PA footprints on real shoots. Avoid wrongful AI flags on client deliveries.

Guide: /remove-photoshop-ai-info

Etsy & POD

Marketplaces can suppress listings with AI metadata. Clean exports before they hit the review queue.

Guide: /remove-metadata-from-png

COMPARE

Why binary stripping beats re-encoding

Feature	RemoveAllLabel	Canvas-based tools	Upload-based tools
Image quality	Lossless — ICC profile kept	Re-compressed, ICC lost	Usually re-compressed
C2PA / APP11 removal	Yes — binary strip	Partial	Yes
Where your files go	Never leave your device	Never leave your device	Uploaded to a server

HONEST BY DESIGN

What this tool does — and what it can't

What it does

✓ Removes C2PA, EXIF, XMP and AI generator tags from files you own

✓ Runs 100% locally in your browser — nothing is uploaded, ever

✓ Keeps pixels, ICC color profile and transparency byte-identical

What it can't do — no tool can

✗ Change a label on a post that is already published

✗ Remove pixel-level watermarks like Google's SynthID

✗ Guarantee a platform's visual classifier won't flag an image

Meta — AI Info policy

TikTok — AIGC guide

C2PA — official spec

DeepMind — SynthID

FAQ

Questions, answered straight

Will this remove the AI Info label on Instagram?

If the label is triggered by C2PA or XMP metadata inside your file, cleaning it before upload removes the most common file-level trigger. Honest limit: no tool can edit labels after posting, and nothing in the file can stop a platform's visual classifier — that is a pixel problem, not a metadata problem.

Do my images get uploaded to your servers?

Is it really lossless? Will my colors shift?

What is the difference between C2PA and SynthID?

Which formats are supported?

Can I use this for client work?

Clean your first image in the next 10 seconds

Free forever. Your photo never touches a server — open the tab, drop the file, done.
